Rural Housing

GENERAL

Volume VI presents cross-tabulations of housing and household characteristics for rural housing units in the United States and its 121 economic subregions. The characteristics are those enumerated in the Censuses of Housing and Population, taken as of April 1, 1960. Generally, the data are presented separately for nonfarm and farm housing units, and for owner-occupied and renter-occupied units. For vacant units, selected characteristics for rural-nonfarm units are presented separately for units available for sale and for those available for rent.

A standard set of tables for occupied units is presented for each economic subregion and for the United States. In addition, cross-tabulations for housing units with nonwhite household heads are presented for subregions having 10,000 or more such units. The vacancy data for all subregions and the United States are presented in one table.

The purpose of this volume is to provide cross-tabulations of housing and household characteristics for analytical uses. For example, the tabulation of income in 1959 according to condition and plumbing facilities provides more specific information than a simple distribution of units by income and another by condition and plumbing facilities. The principal subjects which are crosstabulated by various characteristics are: Rooms, condition and plumbing facilities, income, and year structure built. Other subjects involved in the cross-tabulations include: Persons, persons per room, household composition, year moved into unit, bedrooms, heating equipment, heating fuel, cooking fuel, source of water, sewage disposal, and the number of units having selected equipment items. Equipment items included are: Radio sets, television sets, telephone available, automobiles available, air conditioning, home food freezer, clothes washing machine, and clothes dryer. The subjects presented for vacant units are vacancy status, plumbing facilities, duration of vacancy, and median price or rent asked.

The rim totals of the tables provide the only simple distributions of these characteristics available from the 1960 Censuses of Housing and Population for economic subregions. Simple distributions of housing characteristics of the type covered in this volume are available by counties in 1960 Census of Housing, Volume I, States and Small Areas, and simple distributions of the household characteristics are available in Series PC(1)-C reports which constitute chapter C of 1960 Census of Population, Volume I, Characteristics of the Population.

All the statistics in this volume are based on information for samples of housing units. For about half of the items a 25-percent sample was used; for the remaining items, the sample consisted of either 20 percent or 5 percent of the housing units.

DESCRIPTION OF TABLES

Content of tables.—A series of standard tables is presented for the United States and each economic subregion. Table 1 presents statistics for all occupied units; table 2, for all occupied and owner-occupied units; tables 3 and 4, for owner-occupied and renter-occupied units; and table 5, for cash rent units and no cash rent units separately. Statistics for units with nonwhite household heads in the specific subregions described below are presented by tenure in table 6. Each table except table 7 shows separate statistics for rural-nonfarm and rural-farm units. Table 7 in the series for the United States presents vacancy statistics for rural-nonfarm units; vacant units were not classified by farm residence in the 1960 Census. The subjects that are cross-tabulated in each table are specified in the table on page xii.

Tables 1 and 5.—The principal subject cross-tabulated with selected characteristics is number of rooms. The two tables supplement each other in part since table 1 relates to all occupied units and table 5 to renter-occupied. It is possible for the user to derive cross-tabulated characteristics of owner-occupied units by subtracting the renter-occupied characteristics from the parallel characteristics for total occupied units in table 1, i.e., conditioning and plumbing, persons, year moved into unit, and income in 1959.

Tables 2, 3, and 4.—Selected characteristics are cross-tabulated with condition and plumbing facilities in table 2, income in table 3, and year structure built in table 4.

 $Table\ 6.$ —Data for units with nonwhite household heads are presented only for those economic subregions having 10,000 or more such units. Condition and plumbing facilities are cross-tabulated with characteristics selected from tables 1 to 5.

Table 7.—Vacancy data for the United States and each of the 121 economic subregions are presented in one table in the United States series of tables. Data are in columnar form for each area, numerically arranged.

Consistency of tables.—The total number of occupied units is the same in tables 1 and 2 and is equal to the combined totals of nonfarm and farm owner- and renter-occupied units in tables 3 and 4. Although separate totals of nonfarm and farm owner-occupied units are not shown in tables 2 and 4, they are the same as in table 3. Similarly, renter-occupied totals are the same in tables 3, 4, and 5, although totals are not provided in table 4 for nonfarm and farm units. Within a table however, distributions may not add to the same totals when the subjects are tabulated at different sample rates (see section on "Sample design").

Disclosure of data.—Medians are not shown where the base is smaller than the required minimum. The minimum depends on the sampling rate at which the specified item was tabulated (see section on "Sample design"). A plus (+) or a minus (-) sign after a median indicates that the median is above or below that number. For example, a median of "\$2,000—" for income indicates that the median fell in the interval "less than \$2,000" and was not computed.

Leaders (___)in a data column indicate that either there are no cases in the category or the data are suppressed, for the reason described above.

MAPS

Included in this volume is a map on page vi showing boundaries of economic subregions. In addition, a large detailed map of the economic subregions, showing county and State boundaries, appears on a separate sheet inserted at the end of the volume.

IDENTIFICATION OF ECONOMIC SUBREGIONS

The economic subregions are identified in the tables only by number. A list of the counties in each economic subregion is given on pages vii to xi. The list, numerically arranged, provides the names of the counties by States within each subregion. The subregion locations are shown on each of the maps. The detailed map gives the numbers of the subregions, their boundaries, and the county names and boundaries.

COMPARABILITY WITH 1950 CENSUS

Cross-tabulations of housing and household characteristics by economic subregions were provided for rural-farm occupied housing in 1950 Census of Housing, Volume III, Farm Housing Characteristics. Because of the change in the definition of farm residence, however, the 1960 and 1950 data are not comparable. No cross-tabulations by economic subregions were provided for rural-nonfarm housing. Although data by farm-nonfarm residence are not comparable, simple distributions of total rural housing by counties, as provided in 1950 Census of Housing, Volume I, General Characteristics, are comparable with the 1960 distributions for economic subregions when 1950 data for the appropriate counties are combined.

The subjects involved in cross-tabulations of farm housing in 1950 were generally included in 1960. However, fewer subjects were presented in 1950 in that there were only two basic tables for each area with two additional tables showing cross-tabulations of characteristics for units with nonwhite household heads for areas having 15,000 or more nonwhite inhabitants. In each census, data were presented for both owner- and renter-occupied units. New items in the 1960 program are: Year moved into unit, number of bedrooms, source of water, sewage disposal, and the selected equipment items in table 3. On the other hand, electric lighting and type of household were included in 1950 but not in 1960. In the 1950 tabulations, the principal subjects which were cross-tabulated by various subjects were rooms and condition and plumbing.

Changes were made in the definitions of some of the major concepts, particularly in the definition of the unit of enumeration and the definition of farm housing. They were made in order to improve the usefulness of the data although it was recognized that comparability with previous censuses would be affected.

Procedures for collecting and processing the data in 1960 also differed from 1950. In this respect, the 1960 Census contained several innovations. One of the innovations was the use of forms which household members themselves were asked to complete the Advance Census Report form used on a nationwide basis for complete-count items, and the Household Questionnaire used in the more populous sections of the country for sample items. Information for items not completed by the respondents was obtained by enumerators in direct interview. Other innovations included the division of the census period into two stages, the greater use of sampling, the use of formal field review procedures, and the more extensive use of the electronic computer and related equipment to process the data and produce the final tables. These innovations were designed primarily to improve the quality of the statistics and to reduce the time required to collect and publish the data; at the same time, they have introduced an element of difference between the 1960 statistics and those of

Changes and innovations are discussed in the explanations of the individual items and in the section on "Collection and processing of data."

HOUSING DATA FROM OTHER CENSUSES

Cross-tabulations of housing and household characteristics, as well as simple distributions, were published from the 1940 Census of Housing which was the first complete census of housing. Since economic subregions were first established in 1950, no data comparable to those presented in this volume were available in 1940.

1960 PUBLICATION PROGRAM

Final housing reports.—Results of the 1960 Census of Housing are published in Volumes I to VII and in a joint housing and population series consisting of reports for census tracts. A series of special reports for local housing authorities constitutes the remainder of the final reports. Volumes I to IV and the census tract reports are issued as series of individual reports, with Volumes I and II issued also as bound volumes. Volumes V to VII are issued only as bound volumes.

The source of Volumes I, II, III, VI, and VII and the housing data in the census tract reports is the April enumeration of the 1960 Census of Housing. The special reports for local housing authorities are based on results of the April enumeration and, for most areas, on data collected at a later date for nonsample households.

Data for Volumes IV and V are based largely on the enumeration of units in a sample of land area segments, started in late 1959 and completed in 1960. Separate data are published for the United States and 17 selected metropolitan areas (15 standard metropolitan statistical areas and 2 standard consolidated areas). The areas consist of the New York-Northeastern New Jersey and the Chicago-Northwestern Indiana Standard Consolidated Areas and the following standard metropolitan statistical areas: Atlanta, Boston, Dallas, Detroit, Los Angeles-Long Beach, Philadelphia, Seattle, Baltimore, Buffalo, Cleveland, Minneapolis-St. Paul, Pittsburgh, St. Louis, San Francisco-Oakland, and Washington, D.C.-Md.-Va. The first nine areas named (the two standard consolidated areas and seven standard metropolitan statistical areas) are the areas for which separate data are included in Part 2 of Volume IV.

The titles and contents of the reports are described on page iv. For the most part, the reports are comparable with those published from the 1950 Census of Housing. The 1960 Volumes I, II, and VI are similar to 1950 Volumes I, II, and III, respectively. Volume III of 1960 corresponds to the series of reports on block statistics which constituted 1950 Volume V. Volume IV of 1960 has no 1950 counterpart but corresponds to Volumes I and III of the 1956 National Housing Inventory. Volume V of 1960 corresponds to Volume IV of 1950 and, in part, to Volume II of the 1956 National Housing Inventory. In 1950, census tract reports were published as Volume III of the 1950 Census of Population. Special reports for local housing authorities were published for 219 areas in 1950 Census of Housing, Series HC-6, Special Tabulations for Local Housing Authorities. Data of the type presented in 1960 Volume VII have not been published in previous census reports.

Preliminary and advance reports.—Statistics for many of the subjects covered in the census were released in several series of preliminary and advance reports. The figures in the preliminary and advance reports are superseded by the data in the final reports.

Population reports.—Simple counts of the rural population (farm and nonfarm combined) are published for economic subregions in the United States Summary, chapter A, of 1960 Census of Population, Volume I, Characteristics of the Population. Characteristics of the rural population for counties (separately for the farm population) are published in chapter C for individual States in Volume I of the Population reports.

Data for the rural-farm and rural-nonfarm population in State economic areas, which are subdivisions of economic subregions, are provided in 1960 Census of Population, Volume III, Part 1A, State Economic Arcas. The report covers such subjects as age, sex, and household relationship by color; nativity and parentage; years of school completed; and employment status, occupation, and income.

AVAILABILITY OF UNPUBLISHED DATA

The tabulation procedures used for this volume provided only for the items included herein. Thus no unpublished data are available for economic subregions.

Introduction XV

AREA AND RESIDENCE CLASSIFICATIONS

ECONOMIC SUBREGIONS

"Economic subregions" represent an area concept which was developed for the 1950 Census by the Bureau of the Census in collaboration with the Department of Agriculture and several State and private organizations. Generally, an economic subregion is a combination of two or more groups of relatively homogenous counties which are designated "State economic areas." State economic areas are subdivisions of the State; economic subregions however may cut across State lines. These subregions preserve to a great extent the homogenous character of the State economic areas which they include.

The establishment of State economic areas and economic subregions is a result of the demand from users of census and other types of data for the delineation of areas which have greater uniformity in physical, economic, and social characteristics than States. Demographic, climatic, physiographic, and cultural factors, as well as industrial and commercial activities relating to the production and exchange of agricultural and nonagricultural goods, were taken into consideration in establishing the State economic areas, and in the combination of these areas into the economic subregions.

The economic subregions may be used for a variety of studies in which State data are neither sufficiently refined nor homogeneous, and in which the manipulation of county data presents real difficulty. Where no recognition of State boundaries is needed, economic subregions may be adapted to analyses of the geographic distribution of population and housing characteristics within the country as a whole. These economic subregions provide a larger number of areas than is possible with the use of States, and permit greater flexibility in showing geographic distributions.

No changes were made in the boundaries of the 110 economic subregions between 1950 and 1960. The 121 subregions in 1960 result from the addition of Alaska and Hawaii.

RURAL RESIDENCE

Housing not classified as urban constitutes rural housing. Rural housing comprises a variety of residences, such as isolated homes in the open country and homes in small villages and environs of cities outside urbanized areas.

According to the definition adopted for use in the 1960 Census, urban housing comprises all housing in (a) places of 2,500 inhabitants or more incorporated as cities, boroughs, villages, and towns (except towns in New England, New York, and Wisconsin); (b) the densely settled urban fringe, whether incorporated or unincorporated, of urbanized areas; (c) towns in New England and townships in New Jersey and Pennsylvania which contain no incorporated municipalities as subdivisions and have either 25,000 inhabitants or more or a population of 2,500 to 25,000 and a density of 1,500 persons or more per square mile; (d) counties in States other than the New England States, New Jersey, and Pennsylvania that have no incorporated municipalities within their boundaries and have a density of 1,500 persons or more per square mile; and (e) unincorporated places of 2,500 inhabitants or more. In other words, urban housing comprises all housing units in urbanized areas and in places of 2,500 inhabitants or more outside urbanized areas.

The 1960 definition of rural residence is substantially the same as that used in 1950. In censuses prior to 1950, rural housing comprised all housing outside incorporated places of 2,500 inhabitants or more and a few areas classified as urban under special rules. A more detailed explanation of urban-rural residence in past censuses is given in Volume I of the 1960 Housing reports.

FARM-NONFARM RESIDENCE

In rural territory, occupied housing units are subdivided into rural-farm and rural-nonfarm units on the basis of number of acres in the place and total sales of farm products in 1959. All vacant units are included in the rural-nonfarm inventory. Number of acres in the place was reported for vacant units but no information was obtained on sales of farm products.

Occupied housing units are classified as farm units if they are located on places of 10 or more acres from which sales of farm products amounted to \$50 or more in 1959, or on places of less than 10 acres from which sales of farm products amounted to \$250 or more in 1959. The remaining occupied units, including those on "city lots," are classified as nonfarm units. (A house is on a city lot if it is located in a community or closely built-up area and the "place" is no larger than the house and yard.) Occupied units for which cash rent is paid also are classified as nonfarm if the rent does not include any land used for farming, even though the place on which the unit is located qualifies as a farm.

For purposes of determining farm residence, the residential "place" consists of the land which the respondent considers to be the farm, ranch, or property. The place may consist of more than one tract of land; the tracts are usually adjoining although they may be separated by a road, creek, or another piece of land. If there is more than one house on the place, all have the same farm-nonfarm classification (except that, on farms, units for which cash rent is paid are always classified as nonfarm if the rent does not include any land used for farming). For example, if the operator lives in one house and a hired hand lives in a separate house on the same place, both housing units have the same classification.

Sales of farm products refer to the total amount (gross amount) received from the sale of crops, vegetables, fruits, nuts, livestock and livestock products (milk, wool, etc.), poultry and poultry products, and nursery and forest products produced on the place and sold at any time during 1959.

Farm-nonfarm residence in 1950 was determined for both occupied and vacant units in rural territory by the respondent's answer to the question, "Is this house on a farm or ranch?" Units on farms whose occupants paid cash rent for the house and yard only were classified as nonfarm, similar to the procedure in 1960. Units on institutional grounds and in summer camps and tourist courts were classified as nonfarm in 1950, regardless of the answer to the above question. Housing units in such places in 1960 are classified according to the answers to the questions on acreage and sales of products.

In 1950, a count of farm dwelling units located in cities and other urban territory was obtained, but in the 1960 Census of Housing no effort was made to identify urban-farm units. In 1950, the count of urban-farm units (occupied and vacant) amounted to only about 96,000 in the United States as a whole.

The definition of farm residence adopted for 1960 employs more restrictive criteria than the 1950 definition. One reason for the change was to make the definition of farm residence essentially consistent with the definition of a farm used in the agricultural census, beginning with the 1959 Census of Agriculture. The effect of the 1960 definition is to exclude from the farm inventory, those housing units located on places considered as farms by the occupants but from which agricultural products are not sold or from which sales are below the specified minimum. On the other hand, the 1960 definition brings into the farm inventory a smaller group of housing units which meet the criteria but which are not considered by the occupants to be located on farms.

A test conducted in the Census Bureau's Current Population Survey (CPS) in March 1960 indicated that at that time the change in definition of farm residence resulted in a net reduction of 1.0 million occupied units (households) on farms, representing approximately one-fifth of the farm units under the 1950 definition. The CPS estimate of 4.1 million occupied farm units under the new definition, however, was 0.5 million greater than the April 1960 Census figure of 3.6 million. No similar estimates of

the difference are available by State or smaller area. The impact of the change in definition has probably been very uneven from one area to another.

Although there is no conclusive evidence on the relative validity of the farm-nonfarm classification in the CPS as compared with that in the April 1960 Census, several factors must be taken into consideration in evaluating the figure, 0.5 million. These factors include the more extensive training, control, and experience of the OPS enumerators than of the census enumerators; the use of hourly rate payments in the CPS and of piece-rate payments in the census; the use of self-enumeration in the census; the methods used in weighting the sample estimates; and the difference between the sampling variability in the CPS and in the 25-percent sample in the 1960 Census. There is also a difference between the definition of urban territory in the census and that in the CPS. In the March 1960 CPS, the boundaries of urban areas used were still those of the 1950 Census of Housing and did not include the annexations and other substantial expansions of urban territory that were incorporated in the 1960 Census of Housing. In the 1960 Census, the determination of farm residence was limited to rural territory as defined in 1960. The effect of this difference was to classify an unknown but presumably small number of units as rural farm in the CPS that are treated as urban in the reports of the 1960 Census. Finally, for some of the units in the CPS sample in March 1960, the determination as to farm residence had been made as early as December 1959, whereas the determination for the units in the April 1960 Census was made as of the time of enumeration. In view of the continued decline in the number of farms, it is probable that a number of places that qualified as farms in December would no longer have been so classified in April.

There are differences also between the number of farms as enumerated in the 1959 Census of Agriculture and the number of occupied rural-farm housing units from the 1960 Census of Housing. According to the 1959 Census of Agriculture, there were 3.7 million farms in the United States and 3.4 million farm operators living on the farms they operated. The number of occupied rural-farm housing units according to the 1960 Census of Housing (3.6 million) was 3.8 percent below the number of farms but 3.6 percent above the number of resident farm operators. Even if there had been no errors of enumeration, the number of occupied rural-farm housing units from the Census of Housing would not equal exactly either the number of farms or the number of operators living on the farms they operated. The Census of Agriculture, for example, includes farms in urban territory. Moreover, there are two or more occupied housing units on some farms and no occupied housing units on other farms. In addition, there may be occupied farm housing units even where there is no resident farm operator. Finally, the Census of Agriculture was taken in the fall of 1959, and evidence from other sources suggests that there was some decline in the number of farm units between the time of the Census of Agriculture and the Census of Housing.

Data from a study in which schedules from the 1960 Sample Survey of Agriculture were matched with those from the 1960 Census of Housing suggest that approximately 13 percent of the units occupied by farm operators in rural areas were not classified as farm units in the 1960 Census of Housing. The nature of the matching procedure was such that it was not possible to identify and count the complementary group of units classified as farm in the housing census but as nonfarm in the agriculture survey.

DEFINITIONS AND EXPLANATIONS

The definitions and explanations of terms should be interpreted in the context of the 1960 Census procedures for collecting the data. Data were collected by a combination of self-enumeration, direct interview, and observation by the enumerator.

Items to be filled through self-enumeration appeared on forms which were supplied to households with the request that the household members themselves complete them. In completing the self-enumeration items, the respondent had the explanations and wording that were printed on the forms. His answers were accepted unless the enumerator found it necessary to clarify or correct them.

If the self-enumeration form was not filled or if the answers were incomplete or inconsistent, the enumerator obtained the information through direct interview and recorded it directly on a form specially designed for electronic data processing by FOSDIC. (See section on "Collection and processing of data.")

The enumerator was instructed to read the questions from the FOSDIC schedule and record the replies as given. If the respondent did not understand a question, the enumerator was to explain it based on his understanding of the definitions and instructions in the Enumerator's Reference Manual,

Information for vacant units was obtained by the enumerator largely from owners, landlords, neighbors, or other persons presumed to know the situation, and the enumerator recorded the information directly on the FOSDIC schedules. A few items, including condition of unit, were always determined by the enumerator on the basis of his observation and, therefore, did not appear among the self-enumeration items.

The intent of the questions on the two types of forms is the same, although the wording of some of the questions and response categories on the direct-interview forms is briefer than on the self-enumeration forms. Furthermore, the direct-interview forms omit many of the instructions given on the self-enumeration forms. The differences, however, probably do not contribute in any important way to a lack of comparability of the data obtained from the two methods of enumeration. Through the use of the self-enumeration forms, respondents were given more uniform

explanations of some of the questions than would have been possible in direct interview. On the other hand, the less detailed wording on the direct-interview forms was supplemented by the instructions given to the enumerator.

The questions and the response categories used in self-enumeration compared with those used by the enumerator in direct interview are exhibited in Volume I of the 1960 Housing reports. For population items, the wording on the self-enumeration forms is exhibited in chapter C of Volume I of the 1960 Population reports.

The definitions that follow conform to those provided in the Enumerator's Reference Manuals. They indicate the concept that was intended, whether the information was provided through self-enumeration or obtained by direct interview. Definitions from the 1950 Census also indicate the concepts that were intended, with direct interview as the method of enumeration.

Some of the definitions used in 1960 differ from those used in 1950, as indicated in the explanations of the items. These changes were made after consultation with users of housing census data to improve the statistics even though it was recognized that comparability would be affected. Other factors, such as differences in coverage, also may affect comparability, as explained in the section "Comparability with 1950 Census."

As in all surveys, there were some failures to execute the instructions exactly, regardless of the enumeration procedures applied, and some of the erroneous interpretations have undoubtedly gone undetected.

LIVING QUARTERS

Living quarters were enumerated as housing units or group quarters. Usually a housing unit is a house, apartment, or flat. However, it may be a trailer or a room in a hotel. A structure intended primarily for business or other nonresidential use may also contain a housing unit; for example, the rooms in a warehouse where the watchman lives, or the living quarters of a merchant in back of his shop. Group quarters are found in institutions, dormitories, barracks, rooming houses, and other places where the occupants do not have separate living arrangements.

Housing unit.—A house, an apartment or other group of rooms, or a single room is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters, that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall, or (2) a kitchen or cooking equipment for the exclusive use of the occupants of the unit. The occupants of a housing unit may be a family or other group of persons, or a person living alone.

Trailers, tents, boats, and railroad cars are included in the housing inventory if they are occupied as housing units. They are excluded if they are vacant, used only for extra sleeping space or vacations, or used only for business. Hotel accommodations are housing units if they are the usual residence of the occupants.

Both vacant and occupied housing units are included in the housing inventory. Vacant quarters are excluded, however, if they are still under construction, being used for nonresidential purposes, unfit for human habitation, condemned, or scheduled for demolition (see section on "Vacant housing unit").

Determination of housing unit.—Occupied living quarters were classified as housing units on the basis of information supplied by household members on a self-enumeration form and questions asked by the enumerator where necessary. Identification of vacant housing units was determined by the enumerator, through observation and questions asked of the owners, landlords, or neighbors.

In filling the self-enumeration form, the respondent made the initial determination of the housing unit. The final determination was made by the enumerator. The decision as to what constituted a housing unit was made on the basis of the living arrangements of the occupants, and not on relationship. If only one family lived in the house, the enumerator regarded the quarters as one housing unit and no further probing was necessary to determine whether the quarters were "separate" quarters. (In such cases, direct access and separate cooking facilities were regarded as characteristics of the housing unit rather than criteria of separateness.) On the other hand, if there was evidence of additional separate quarters, such as a second mailbox, or doorbell, or the presence of other relatives or nonrelatives, the enumerator was to determine whether there were additional housing units on the basis of either direct access or separate cooking facilities. Quarters that did not meet either criterion were not considered sufficiently separate to qualify as housing units. Quarters whose occupants shared living arrangements were combined into one housing unit (unless the combined quarters contained five or more persons unrelated to the head, in which case the quarters were considered group quarters).

Living quarters are regarded as having direct access if the entrance is direct from the outside of the structure, or through a common hall, lobby, or vestibule used by the occupants of more than one unit. The hall, lobby, or vestibule must not be part of any unit, but must be clearly separate from all units in the structure. Living quarters have access through another unit when the only entrance to the room or rooms is through a room or hall which is part of the other unit.

A kitchen is defined as a room used primarily for cooking and the preparation of meals. Cooking equipment is defined as (1) a range or stove, whether or not it is regularly used, or (2) other equipment such as a hotplate or electrical appliance if it is used for the regular preparation of meals. Equipment is for exclusive use if it is used only by the occupants of one unit (see also discussion of exclusive or shared use in the section on "Plumbing facilities"). Vacant units are considered to have cooking equipment if the last occupants had such equipment.

Hotel, motel.—Occupied rooms or suites of rooms in hotels, motels, and similar places are classified as housing units only when occupied by usual residents, i.e., persons who consider the hotel as their usual place of residence or have no usual place of residence elsewhere. Vacant rooms or suites of rooms are classified as housing units only in those hotels in which 75 percent or more of the accommodations are occupied by usual residents. The 75-percent limit is an arbitrary rule, the intent being to exclude from the housing inventory those quarters usually occupied by transient guests.

The distinction between hotels and rooming houses in the 1960 Census was made by the enumerator, generally on the basis of local usage.

Rooming house, boarding house.—If any of the occupants in a rooming or boarding house have separate quarters and do not share living arrangements with other occupants in the struc-

ture, such quarters are considered separate housing units. The remaining quarters are combined. If the combined quarters contain four or fewer roomers unrelated to the head, they are classified as one housing unit; if the combined quarters contain five or more roomers unrelated to the head or person in charge, they are classified as group quarters. In a dormitory, residence hall, nurses' home, or similar place, living quarters of the supervisory staff are separate housing units if they satisfy the housing unit criteria; other living quarters are considered group quarters.

Institution.—Living quarters of staff personnel are separate housing units if they satisfy the housing unit criteria. Other living quarters are considered group quarters (see section on "Group quarters").

Comparability.—In 1950, the unit of enumeration was the dwelling unit. Although the definition of "housing unit" in 1960 is essentially similar to that of "dwelling unit" in 1950, the housing unit definition was designed to encompass all private living quarters, whereas the dwelling unit definition did not cover all private living accommodations. In 1950, a dwelling unit was defined as (1) a group of rooms occupied or intended for occupancy as separate living quarters and having either separate cooking equipment or separate entrance; or (2) a single room occupied or intended for occupancy as separate quarters if (a) it had separate cooking equipment, (b) it was located in a regular apartment house, or (c) it constituted the only living quarters in the structure.

The main difference between housing units and dwelling units is in the treatment of one-room quarters. In 1960, separate living quarters consisting of one room with direct access but without separate cooking equipment qualify as a housing unit whether in an apartment house, rooming house, or house converted to apartment use. In hotels in 1960, a single room qualifies as a housing unit if occupied by a person whose usual residence is the hotel or a person who has no usual residence elsewhere; a vacant room (including quarters temporarily occupied by a nonresident) qualifies as a housing unit only if 75 percent or more of the accommodations in the hotel are occupied by usual residents. In 1950, a one-room unit without separate cooking equipment qualified as a dwelling unit only when located in a regular apartment house or when the room constituted the only living quarters in the structure. In hotels in 1950, occupied and vacant quarters that satisfied the dwelling unit criteria were included in the housing inventory only if more than half the accommodations in the hotel were for permanent guests; if less than half, none of the quarters were included in the housing inventory.

The evidence thus far suggests that the use of the housing unit concept in 1960 instead of the dwelling unit concept as in 1950 had relatively little effect on the counts for large areas and for the Nation, particularly in rural territory. Any effect which the change in concept may have on comparability can be expected to be greatest in statistics for certain census tracts and blocks, shown in other reports. Living quarters classified as housing units in 1960 but which would not have been classified as dwelling units in 1950 tend to be clustered in tracts and blocks where many persons live separately in single rooms in hotels, rooming houses, and other light housekeeping quarters.

Group quarters.—Occupied quarters which do not qualify as housing units are considered group quarters. They are located most frequently in institutions, hospitals, nurses' homes, rooming and boarding houses, military and other types of barracks, college dormitories, fraternity and sorority houses, convents, and monasteries. Group quarters are also located in a house or apartment in which the living quarters are shared by the head and five or more persons unrelated to him. Group quarters are not included in the housing inventory. The 1960 concept of group quarters is similar to the 1950 concept of nondwelling-unit quarters.

According to the results of the 1960 Census of Population, approximately 4.9 million people or 2.8 percent of the total population of the United States lived in rooming houses, institutions, transient accommodations, and other quarters not defined as housing units. In 1950, the number of persons whose quarters were not included in the housing inventory was 5.7 million or 3.8 percent of the total 1950 population. These figures are not entirely comparable with the 1960 figures. It is probable, due to the change in the definition from "dwelling unit" to "housing unit," that some one-room quarters which are housing units in 1960 would not have been dwelling units according to the 1950 definition.

OCCUPANCY CHARACTERISTICS

Occupied housing unit.—A housing unit is "occupied" if it is the usual place of residence of the person or group of persons living in it at the time of enumeration. Included are units occupied by persons who are only temporarily absent, such as persons on vacation. Units occupied by persons with no usual place of residence are also considered "occupied." For example, a unit occupied by migratory workers who have no usual residence elsewhere is considered occupied; however, if the migrants have a residence elsewhere, the unit in which they are temporarily living is classified as vacant. The persons who occupy a housing unit constitute the household (see definition of household in the section on "Household characteristics").

The same definition for classifying a unit as occupied was used in the 1950 Census.

Nonwhite household heads.—Occupied housing units are classified according to the color of the head of the household. Separate data for units with nonwhite household heads are published for the United States and each economic subregion having 10,000 or more such units. The color group "nonwhite" consists of such races or ethnic groups as Negro, American Indian, Japanese, Chinese, Filipino, Hawaiian, Eskimo, Aleut, Korean, Asian Indian, and Malayan. Persons of Mexican birth or ancestry who are not definitely of Indian or other nonwhite race are classified as white. Persons of mixed racial parentage are classified as nonwhite. The same definition was used in 1950.

The concept of race, as it has been used by the Bureau of the Census, is derived from that which is commonly accepted by the general public. The use of self-enumeration in the 1960 Census may have affected the accuracy of the data on color as compared with earlier censuses. Whereas formerly the classification was obtained in most cases by the enumerator's observation, in 1960 it was possible for members of the household to classify themselves.

Persons.—All persons enumerated in the 1960 Census of Population as members of the household were counted in determining the number of persons who occupied the housing unit. These persons include not only occupants related to the head but also any lodgers (roomers, boarders, partners, wards, foster children) and resident employees who share the living quarters of the household head.

The median number of persons for occupied housing units is the theoretical value which divides the distribution into two equal parts—one-half the units having more persons and one-half having fewer persons than the median. In the computation of the median, a continuous distribution was assumed, with the whole number of persons as the midpoint of the class interval. For example, when the median was in the 3-person group, the lower and upper limits were assumed to be 2.5 and 3.5 persons, respectively. The median was computed on the basis of the tabulation groups shown in the table. If the median falls in the category "7 persons or more," it is shown in the table as "6.5+" persons.

The same concept was applied in the 1950 Census. Comparability between 1950 and 1960 data may be affected to some small extent by the change in concept from dwelling unit to housing unit

Persons per room.—The number of persons per room was computed for each occupied housing unit by dividing the number of persons by the number of rooms in the unit. The tabulation form contained a terminal category of "10 or more" rooms; for purposes of the computation, the terminal category was given a mean value of 11. Essentially the same procedure was used for the 1950 Census.

Tenure.—A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. The owner need not be the head of the household. A cooperative apartment unit is "owner occupied" only if the owner lives in it.

All other occupied units are classified as "renter occupied," including units rented for cash as well as units occupied without payment of cash rent. Units rented for cash are units for which any money rent is paid or contracted for. Such rent is commonly paid by the occupants but may be paid by persons not living in the unit—for example, a welfare agency. Units for which no cash rent is paid include units provided by relatives not living in the unit and occupied without rental payment, units provided in exchange for services rendered, and units occupied by a tenant farmer or sharecropper who does not pay any cash rent.

Essentially the same definition of tenure was used in the 1950 Census.

Year moved into unit.—Data on year moved into unit are based on the information reported for the head of the household. The question refers to the year of latest move. Thus, if the head moved back into a unit he had previously occupied, the year he moved back was to be reported; if he moved from one apartment to another in the same building, the year he moved into his present unit was to be reported.

The intent of the question is to establish the year the present occupancy of the unit began, as indicated by the year the household head moved into the unit. The year the head moves is not necessarily the same year other members of the household move, although in the great majority of cases the entire household moves at the same time. The statistics roughly reflect turnover in occupancy of units but do not necessarily indicate the total number of changes in occupancy that have occurred in a given period.

Data on year moved into the unit were not collected in censuses prior to 1960.

Vacant housing unit.—A housing unit is "vacant" if no persons are living in it at the time of enumeration. However, if its occupants are only temporarily absent, the unit is considered occupied. Units temporarily occupied entirely by persons having a usual place of residence elsewhere are classified as vacant (the unit at their usual residence is considered occupied). A vacant unit may be furnished or unfurnished; it may be offered for rent or sale; it may have been rented or sold but the new occupants have not moved in; or it may be held off the market for the owner's occasional or future use, for speculation, or for other reasons.

Newly constructed vacant units are included in the inventory if construction has reached the point that all the exterior windows and doors are installed and the final usable floors are in place. If construction has not reached this point, the unit is excluded. Dilapidated vacant units are included, provided they are still usable as living quarters; they are excluded if they are unfit for human habitation. Vacant units are defined as unfit for human habitation if, through deterioration or vandalism, most of the doors and windows are missing and the floors are unsafe.

Vacant quarters are excluded from the housing inventory if there is positive evidence (a sign, notice, or mark on the house or in the block) that the unit is to be demolished. Vacant quarters condemned for reasons of health or safety so that further occupancy is prohibited are likewise excluded from the inventory. Also excluded are quarters being used for commercial or business purposes; quarters used for the storage of hay, machinery, business supplies, and the like; and vacant trailers.

With few exceptions, the same general instructions were used in 1950. In the 1960 Census, however, the instructions for enumerating certain vacant units were more specific than in 1950, particularly the instructions regarding units to be demolished, units unfit for human habitation, and units being used for non-residential purposes. It is possible also that comparability is affected in some areas by the change from "dwelling unit" to "housing unit."

Available vacant.—The count of available vacancies constitutes a measure of vacant units on the housing market. It consists of units which are for year-round occupancy, are in either sound or deteriorating condition, and are offered for rent or for sale. Excluded are seasonal units; dilapidated units; and units already rented or sold, held for occasional use, or not on the rental or sale market for other reasons.

Year-round housing units are units which are usually occupied or intended for occupancy at any time of the year. A unit used only occasionally throughout the year is considered a year-round unit. In resort areas, a unit which is usually occupied on a year-round basis is also considered a year-round unit. Seasonal units are intended for occupancy during only a season of the year. Included are units intended for summer or winter recreational use, such as beach cottages and hunting cabins; units held for herders, loggers, and cannery workers; and units intended for migratory workers employed in farmwork during the crop season.

XIX

The 1960 categories "available for sale" and "available for rent" are comparable with the 1950 categories "nonseasonal not dilapidated, for sale" and "nonseasonal not dilapidated, for rent" since essentially the same concepts were used; however, no comparable tabulations are available from the 1950 Census for economic subregions.

Units available for sale only are the available vacant units which are offered for sale only; they exclude units offered "for sale or rent." Vacant units in a cooperatively owned apartment building are included if the individual unit is "for sale only." A vacant unit in a multiunit structure which is for sale as an entire structure is included if that unit is intended to be occupied by the new owner and if the unit is not also for rent.

Units available for rent are the available vacant units which are offered for rent and those offered for rent or sale at the same time.

Duration of vacancy.—The duration of vacancy is the length of time (in months) from the date the last occupants moved from the unit to the date of enumeration. The data, therefore, do not provide a direct measure of the total length of time units remain vacant. For newly constructed units which have never been occupied, the duration of vacancy represents the time period since the date construction was completed.

No information on duration of vacancy was collected in previous censuses.

STRUCTURAL CHARACTERISTICS

Bedrooms.—The number of bedrooms is the count of rooms used mainly as bedrooms. In addition to regular bedrooms, the count includes studies, dens, enclosed porches, finished attics, guest rooms, or other extra rooms if they are currently used principally and regularly for sleeping. Rooms used only occasionally for sleeping, such as a living room with a hideaway bed, were not to be counted as bedrooms. A housing unit consisting of only one room, such as a one-room efficiency apartment, was to be reported as having no bedroom. Information about the number of bedrooms was not collected in the 1950 Census.

Rooms.—The number of rooms is the count of whole rooms used for living purposes, such as living rooms, dining rooms, bedrooms, kitchens, finished attic or basement rooms, recreation rooms, lodgers' rooms, and rooms used for offices by a person living in the unit. Not considered as rooms are bathrooms; halls, foyers, or vestibules; closets; alcoves; pantries; strip or pullman kitchens; laundry or furnace rooms; unfinished attics, basements, and other space used for storage; porches, unless they are permanently enclosed and suitable for year-round use; and offices used only by persons not living in the unit. A partially divided room, such as a dinette next to a kitchen or living room, is considered as a separate room if there is a partition from floor to ceiling. Rooms equipped with movable partitions from floor to ceiling are separate rooms. If a room is shared by occupants of more than one unit, it is included with the unit from which it is most easily reached.

The median number of rooms is the theoretical value which divides the distribution of units into two equal parts—one-half the units having more rooms and one-half having fewer rooms than the median. The median number of rooms was computed in the same manner as the median number of persons. If the median falls in the terminal category "7 rooms or more," it is shown as "6.5+" rooms.

The 1960 definition of rooms is essentially the same as that used in the 1950 Census. Comparability may be affected to some small extent, however, by the change from dwelling unit to housing unit.

Year structure built.—"Year built" refers to the date the original construction of the structure was completed, not to any later remodeling, addition, or conversion. For trailers, the model year was assumed to be the year built.

The figures on the number of units built during a given period relate to the number of units in existence at the time of enumeration. The figures reflect the number of units constructed during a given period plus the number created by conversions in structures originally built during that period, minus the number lost

in structures built during the period. Losses occur through demolition, fire, flood, disaster; change to nonresidential use; or merger to fewer housing units.

Data on year built are more susceptible to errors of response and nonreporting than data on many of the other items. In most cases, the information was given according to memory or estimates of the occupants of the structure or of other persons who had lived in the neighborhood a long time.

Data on year built were collected in the 1950 Census of Housing also. While the definitions were the same, comparability of the data may be affected by relatively large reporting errors.

CONDITION AND PLUMBING FACILITIES

Condition and plumbing combined.—Both the condition of a housing unit and the type of plumbing facilities are considered measures of the quality of housing. Categories representing various levels of housing quality have been established by presenting the items in combination.

To measure condition, the enumerator classified each housing unit in one of three categories: Sound, deteriorating, or dilapidated. The plumbing facilities that are combined with condition are: Water supply, toilet facilities, and bathing facilities.

Condition.—The enumerator determined the condition of the housing unit by observation, on the basis of specified criteria related to the extent or degree of visible defects. The types of defects the enumerator was to look for are associated with weather tightness, extent of disrepair, hazards to the physical safety of the occupants, and inadequate or makeshift construction. These are signs of other structural defects which may be hidden. Defects which would be revealed only by a more careful inspection than is possible during a census, such as the presence of dampness or infestation, inadequate wiring, and rotted beams, are not included in the criteria for determining the condition of a unit.

Sound housing is defined as that which has no defects, or only slight defects which normally are corrected during the course of regular maintenance. Examples of slight defects are: Lack of paint; slight damage to porch or steps; slight wearing away of mortar between bricks or other masonry; small cracks in walls, plaster or chimney; cracked windows; slight wear on floors, doorsils, doorframes, window sills, or window frames; and broken gutters or downspouts.

Deteriorating housing needs more repair than would be provided in the course of regular maintenance. Such housing has one or more defects of an intermediate nature that must be corrected if the unit is to continue to provide safe and adequate shelter. Examples of intermediate defects are: Holes, open cracks, rotted, loose, or missing material over a small area of the foundation, walls, roof, floors, or ceilings; shaky or unsafe porch, steps, or railings; several broken or missing windowpanes; some rotted or loose window frames or sashes that are no longer rainproof or windproof; broken or loose stair treads, or broken, loose, or missing risers, balusters, or railings of inside or outside stairs; deep wear on doorsills, doorframes, outside or inside steps or floors; missing bricks or cracks in the chimney which are not serious enough to be a fire hazard; and makeshift chimney such as a stovepipe or other uninsulated pipe leading directly from the stove to the outside through a hole in the roof, wall, or window. Such defects are signs of neglect which lead to serious structural deterioration or damage if not corrected.

Dilapidated housing does not provide safe and adequate shelter and in its present condition endangers the health, safety, or well-being of the occupants. Such housing has one or more critical defects; or has a combination of intermediate defects in sufficient number or extent to require considerable repair or rebuilding; or is of inadequate original construction. The defects are either so critical or so widespread that the structure should be extensively repaired, rebuilt, or torn down.

Critical defects result from continued neglect or lack of repair, or indicate serious damage to the structure. Examples of critical defects are: Holes, open cracks, or rotted, loose, or missing material (clapboard siding, shingles, bricks, concrete, tile, plaster, or floorboards) over a large area of the foundation, outside walls, roof, chimney, or inside walls, floors, or ceilings; substantial sagging of floors, walls, or roof; and extensive damage by storm, fire, or flood.

To be classified as dilapidated on the basis of intermediate defects, a housing unit must have such defects in sufficient num-

ber or extent that it no longer provides safe and adequate shelter. No set number of intermediate defects is required.

Inadequate original construction includes: Shacks, huts, or tents; structures with makeshift walls or roofs, or built of packing boxes, scrap lumber, or tin; structures lacking foundations (walls rest directly on the ground); structures with dirt floors; and cellars, sheds, barns, garages, or other places not originally intended for living quarters and inadequately converted to such use.

The enumerator was instructed to judge each unit on the basis of its own characteristics, regardless of the neighborhood, age of the structure, or the race or color of the occupants. He was cautioned, for example, that although lack of paint is only a slight defect, this and other signs of neglect are warnings to look closely for more serious defects. Also, exterior covering may improve the appearance of a structure but not its condition, and the sturdiness of brick or other masonry walls can be misleading if there are defects in other parts of the structure.

In judging condition, the enumerator was instructed to determine whether the unit was dilapidated or not dilapidated. If the unit was "not dilapidated," then he was to classify it as "sound" or "deteriorating." The use of this technique in 1960 was designed to maintain comparability with the 1950 enumeration of condition, when only the two categories, not dilapidated and dilapidated, were reported. The change to the three-way classification of condition in 1960 reflects the growing interest in housing quality and its importance in slum clearance and urban renewal programs.

The new classification and improved training techniques, designed to yield more adequate measures of potential urban blight, were developed by a group of experts working with the census staff. Field studies were conducted to explore the feasibility of the three-way classification and to test various types of training instructions that would define and convey to enumerators the concepts of the three levels of condition. While the 1950 concept and definition of the category "dilapidated" were retained without change for 1960, additional study was required to develop the concepts and terminology for the two other categories.

The enumerator was provided with detailed written instructions and with photographs illustrating the levels of condition. In addition, audio-visual techniques were used in training the enumerator. A filmstrip of photographs in color depicted various types of defects and a recorded narrative explained how to determine the classification of condition on the basis of these defects. (Photographs and instructions from the Enumerator's Reference Manual are reproduced in the United States Summary chapter of Volume I of the 1960 Housing reports.)

Although detailed oral and written instructions and visual aids were provided, it was not possible to achieve uniform results in applying the criteria for determining the condition of a unit. Data on condition for small areas, which depend on the work of only a few enumerators, may have a wider margin of relative error than data for larger areas, which are based on the work of a number of enumerators.

The 1960 and 1950 definitions of "dilapidated" are considered comparable, since the basic 1950 concept of dilapidation was retained in 1960. The 1960 concepts of "sound" and "deteriorating" combined are comparable with the 1950 concept "not dilapidated." It is possible, however, that the change in categories introduced an element of difference between the 1960 and 1950 statistics.

Plumbing facilities.—The facilities referred to are water supply, totalet facilities, and bathing facilities. A unit has piped water if it is available inside the structure. The piped water need not be available within the unit. A unit has a flush toilet if this facility is inside the structure, is connected to piped water, and is available for the use of the occupants of the unit. A unit has a bathtub or shower if either facility, supplied with piped water (not necessarily hot water), is inside the structure and available for the use of the occupants of the unit.

The category "with all plumbing facilities" consists of units which have piped hot and cold water inside the structure and flush toilet and bathtub (or shower) inside the structure for the exclusive use of the occupants of the unit.

The category "lacking some facilities" shown in some tables is the same as "lacking some facilities, with piped water" shown in other tables. This category consists of units which have piped water inside the structure but lack one or more of the other plumbing facilities. Specifically, these are units with piped water, but without flush toilet or bath inside the structure; units with piped water whose occupants share toilet or bathing facilities with the occupants of another housing unit; and units with only cold piped water. The category "no piped water" consists

of units which have no plumbing facilities inside the structure although there may be piped water on the property outside the structure. Units having only a hand pump inside are considered to have no piped water.

Facilities are for exclusive use if they are used only by the occupants of the one housing unit, including lodgers or other unrelated persons living in the housing unit. Facilities are shared if they are used by occupants of two or more housing units, or if they would be shared with the occupants of a unit now vacant. Shared facilities may be inside one of the units in the structure or may be centrally located where they can be reached by occupants of all units that share them.

Facilities are located inside the structure if they are located inside the same structure as the housing unit. They may be located within the housing unit itself, or they may be located in a hallway or in a room used by occupants of several units. It may even be necessary to go outdoors to reach that part of the structure in which the facilities are located. Facilities located in the basement or on an enclosed porch, or enclosed by partitions on an otherwise open porch, are "inside the structure." Facilities on an open porch (for example, piped water) are "outside the structure."

The presentation of plumbing facilities in this volume differs from the presentation in other 1960 housing reports because the absence of piped water inside the structure is a more common characteristic in rural areas than in urban areas. Thus, the categories "with some facilities" and "no piped water" are used instead of the single category "lacking some or all facilities" generally used in other reports. Furthermore, no separate category is shown in this volume for units lacking only hot water as in Volume I.

The concepts used for plumbing facilities for the 1960 Census are the same as those used for the 1950 Census. If the respective categories under "sound" and "deteriorating" are combined, the 1960 "with all plumbing facilities" compares with the 1950 category "not dilapidated, with private toilet and bath, and hot running water." Similarly, the category "lacking some facilities" (or "lacking some facilities, with piped water") in 1960 compares with the combination of four categories used in the 1950 volume on farm housing characteristics: "With private toilet and bath and only cold water," "with running water and private toilet, lacking private bath," "with running water and private bath, lacking private toilet" and "with running water, lacking both private toilet and bath."

Source of water.—The source of water was to be reported in one of three categories. "Public system or private company" refers to a common source supplying running water to more than five houses. The source may be a city or county water department, a water district, a private water company, or a cooperative or partnership group, "Individual well" describes a source which serves five or fewer houses from a well on the property of the unit being enumerated or on a neighboring property. The water from such a well may be hand drawn, wind drawn, or power drawn. It may be piped or not piped; it may be stored in tanks or used directly from the well. (Because the criterion of "five or fewer" houses did not appear on the self-enumeration form. it is possible that some units were reported in the category "individual well" although the well serves more than five houses.) "Other" describes water coming directly from springs, creeks, rivers, ponds, lakes, and all other sources. No data on source of water were collected in previous censuses.

Sewage disposal.—This item refers to the sewage disposal system for the structure in which the unit is located. The category "public sewer" applies to units that are connected to a city, county, sanitary district, neighborhood, or subdivision sewer system. A "septic tank or cesspool" is an underground tank or pit for sewage disposal. Small sewage treatment plants which in some localities are called neighborhood septic tanks are classified as public sewers. Units for which sewage is disposed of in some other way are included in the category "other or none." No data on sewage disposal were collected in previous censuses.

EQUIPMENT AND FUELS

Air conditioning.—Air conditioning is defined as the cooling of air by refrigerating apparatus. Excluded are evaporative coolers and fans or blowers which are not connected to a refrigerIntroduction XXI

ating apparatus. Both room units and central air conditioning systems are included. A room unit is an individual air conditioner designed to cool one room. A central system is an installation which air conditions a number of rooms. In an apartment building, a central system usually provides air conditioning for all the apartments. The statistics are expressed in terms of the number of housing units with air conditioning; they do not reflect the number of air conditioning installations. Air conditioning was not included in the 1950 Census.

Automobiles available.—The data on automobiles available apply to passenger automobiles, including station wagons, owned or regularly used by any of the occupants of the housing unit. Passenger cars were to be counted if they were owned by a member of the household or if they were regularly used and ordinarily kept at home, such as some company cars. Not to be counted were taxis, pickups or larger trucks, and dismantled or dilapidated cars in an early stage of being junked. The statistics do not reflect the number of automobiles privately owned or the number of households owning one or more automobiles.

Data on automobiles were not collected in censuses prior to 1960.

Clothes dryer.—A clothes dryer is defined as a separate mechanical appliance in which clothes are dried by air, heated either by electricity or gas. Units with a washer-dryer combination are classified as units having no clothes dryer since the dryer is not a separate appliance. (The washer-dryer combination is tabulated under clothes washing machine.)

A clothes dryer owned by a member of the household was to be reported whether it was located in the housing unit or elsewhere on the property. Dryers used but not owned by members of the household, such as those provided by the management of an apartment building, were not to be reported.

The 1960 Census is the first census to provide information on clothes dryers.

Clothes washing machine.—A clothes washing machine is defined as any power-operated machine including the wringer or spinner types, automatic, semiautomatic, and washer-dryer combinations.

A clothes washing machine owned by a member of the household was to be reported, whether it was located in the housing unit or elsewhere on the property. Machines used but not owned by members of the household, such as those provided by the management of an apartment building, were not to be reported.

The 1960 Census is the first census to provide information on clothes washing machines.

Cooking fuel.—The fuel to be reported was the fuel that was used most for cooking. The definitions of the categories are the same as those for heating fuel, except that wood is included with "other fuel" in table 1.

Similar information on cooking fuel was collected in the 1950 Census.

Heating equipment.—"Steam or hot water" refers to a central heating system in which heat from steam or hot water is delivered through radiators or other outlets. "Warm air furnace" refers to a central system which provides warm air through ducts leading to the various rooms.

"Built-in room units" are permanently installed heating units in floors, walls, or ceilings. They include floor, wall, or pipeless furnaces as well as built-in electrical units. Floor, wall, and pipeless furnaces deliver warm air to immediately adjacent rooms but do not have ducts leading to other rooms. Heat pumps are included with built-in room units.

"Other means with flue" describes stoves, radiant gas heaters, fireplaces, and other equipment connected to a chimney or flue

which carries off the smoke or fumes. "Other means without flue" describes electric heaters, electric steam radiators, kerosene heaters, radiant gas heaters, and other portable or plug-in devices not connected to a chimney or flue.

The main type of heating equipment was to be reported even if it was temporarily out of order at the time of enumeration. If two types of heating equipment were used to about the same extent, the type appearing first in the sequence above was to be reported. For vacant units from which the heating equipment had been removed, the equipment used by the last occupants was to be reported. The statistics are expressed in terms of the number of housing units heated by the particular type of equipment; they do not reflect the number of heating installations.

The category "steam or hot water" is unchanged from 1950, and "other means with flue" is identical with the 1950 category "noncentral heating, with flue." Floor, wall, and pipeless furnaces were included with "warm air furnaces" in 1950, but in 1960 are tabulated as "built-in room units." The built-in electrical units were included with "noncentral heating, without flue" in 1950.

Heating fuel.—The fuel to be reported was the fuel used most for heating the unit. In reporting gas as the fuel, a distinction was made between "utility gas" and "bottled, tank, or LP gas." Utility gas is piped in from a central system serving the community. Such gas is supplied by a public utility company, municipal government, or similar organization. Bottled, tank, or LP (liquefied petroleum) gas is supplied in containers which are replaced or refilled as necessary. "Fuel oil, kerosene, etc." includes fuel oil, kerosene, gasoline, alcohol, and other combustible liquids. "Other fuel" includes purchased steam, waste materials (such as corncobs), and other fuels not specified above.

Similar information on fuel used for heating the unit was collected in 1950. Although the definitions of the types of fuel are the same in both censuses, the wording of some of the categories is more specific in 1960. For example, the 1960 category "bottled, tank, or LP gas" is identical with the 1950 "liquid or bottled gas"; "fuel oil, kerosene, etc." of 1960 is the same as "liquid fuel" of 1950, and "coal or coke" in 1960 is equivalent to "coal" in 1950.

Home food freezer.—A home food freezer is defined as an appliance, separate from the refrigerator, which freezes food and keeps it frozen. The freezer must be located in the housing unit or elsewhere on the property. Excluded is a freezer combined in the same cabinet with a refrigerator, even if it has a separate door.

In 1950, information as to mechanical and nonmechanical refrigeration equipment was reported but no information was obtained on separate appliances for freezing food.

Radio sets.—Sets of all kinds located in the unit were to be included in the count—floor, table, portable, and combination with television, phonograph, or clock. Sets in working order and sets being repaired were to be reported. A combination radio-television set was to be reported both as a radio and as a television set. The following types of radios were to be excluded: Sets which were not in working order and were not being repaired, automobile radios, sending-receiving sets ("ham radio" sets) and crystal sets. Information on units with radio was collected in the 1950 Census also.

Telephone available.—A unit is classified as having a telephone if there is a telephone available to the occupants of the unit for receiving calls. The telephone may be located inside or outside the housing unit, and one telephone may serve the occupants of several units. The number of housing units with telephones available, therefore, does not indicate the number of subscribers or the number of telephones installed in homes.

No data on telephones were collected in censuses prior to 1960.

Television sets.—Sets of all kinds located in the unit were to be reported—floor, table, built-in, portable, and combination with radio or phonograph. Sets in working order and sets being repaired were to be included. A combination radio-television set was to be reported both as a television and as a radio set.

Information on units with television was collected in the 1950 Census also.

FINANCIAL CHARACTERISTICS

Financial data for rural housing are limited to nonfarm units in rural areas. The data presented in this volume include only the median price asked and median rent asked for vacant ruralnonfarm units in the United States and economic subregions. All vacant units in rural territory are included in the ruralnonfarm inventory.

Rent asked.—For vacant units, the monthly rent is the amount asked for the unit. The rent is the amount asked at the time of enumeration and may differ from the rent contracted for when the unit is occupied. The data are restricted to vacant units available for rent. Further, the data exclude rents for vacant units on places of 10 acres or more.

The median rent asked is the theoretical rent which divides the distribution into two equal parts—one-half the cases falling below this rent and one-half the cases exceeding this rent. In the computation of the median, the lower limit of a class interval was assumed to stand at the beginning of the rent group and the upper limit at the beginning of the successive rent group. Medians were rounded to the nearest whole dollar.

Monthly rent for vacant units was included in the 1950 Census also.

Sale price asked.—For vacant units, the sale price is the amount asked for the property including the structure and land. The price is the amount asked at the time of enumeration and may differ from the price at which the property is sold. The data are restricted to properties available for sale which have only one housing unit and no business. Units in multiunit structures and units on places of 10 acres or more were excluded from the tabulations

The median price asked is the theoretical value which divides the distribution into two equal parts—one-half the cases falling below this value and one-half the cases exceeding this value. In the computation of the median, the lower limit of a class interval was assumed to stand at the beginning of the value group and the upper limit at the beginning of the successive value group. Medians were rounded to the nearest hundred dollars.

Essentially the same concept was used in the 1950 Census.

HOUSEHOLD CHARACTERISTICS

Data on household characteristics are based on information reported for each member of the household. Each person was enumerated by name, and information was recorded on relationship to head, sex, age, marital status, income, and other population characteristics, as applicable.

Household.—A household consists of all the persons who occupy a housing unit. By definition, therefore, the count of occupied housing units is the same as the count of households.

Head of household.—The head of the household is the person considered to be the head by the household members. However, if a married woman living with her husband is reported as the head, her husband is classified as the head for the purpose of census tabulations.

Household composition.—Each household in the group "male head, wife present, no nonrelatives" consists of the head, his wife, and other persons, if any, all of whom are related to him. A household was classified in this category if both the husband and wife were reported as members of the household even though one or the other was temporarily absent on business or vacation, visiting, in a hospital, etc., at the time of the enumeration. The

category "other male head" includes households with male head, wife present, with nonrelatives living with them; male heads who are married, but with wife absent because of separation or other reason where husband and wife maintain separate residences for several months or more; and male heads who are widowed, divorced, or single. "Female head" comprises all households with female heads regardless of their marital status. Included are female heads with no spouse and female heads whose husbands are living away from their families, as for example, husbands in the Armed Forces living on military installations.

Statistics for the three types of households defined above are presented for households having two or more persons. Households consisting of only one person are shown separately and not included in the subcategories "other male head" and "female head."

A similar classification under the subject "Sex and age of head of household" was provided in 1950. The categories differ, however, in that one-person households in the 1960 report are shown separately and are not included in the categories "other male head" and "female head," as in the 1950 report.

Nonrelative.—A nonrelative of the head is any member of the household who is not related to the household head by blood, marriage, or adoption. Lodgers (roomers, partners, wards, and foster children) and resident employees are included as nonrelatives.

Primary family; primary individual.—The term "primary family" refers to the head of a household and all (one or more) persons in the household related to him by blood, marriage, or adoption. If the head lives alone or if no member of the household is related to him, the head constitutes a "primary individual." A household can contain only one primary family or primary individual.

Married couples related to the head of a family are included in the primary family and are not classified as separate families. A lodger, servant, or other person unrelated to the head is considered a member of the household but not of the primary family.

In the statistics on household composition, primary families are always included in one of the three major groups of two-ormore-person households. Primary individuals living alone are always tabulated as one-person households; primary individuals with nonrelatives living with them are tabulated as "other male head" or "female head."

Income.—Income is the sum of money received, less losses, from wages or salary, self-employment, and sources other than earnings during the calendar year 1959. In this report, the statistics are restricted to income received by the primary family or primary individual. The figures represent the amount of income received before deductions for personal income taxes, Social Security, bond purchases, union dues, etc. Wage or salary income is defined as the total money earnings received for work performed as an employee. It includes wages, salary, pay from Armed Forces, commissions, tips, piece-rate payments, and cash bonuses earned. Self-employment income is defined as net money income (gross receipts minus operating expenses) from a business, farm, or profession. Income other than earnings includes money received from sources such as net income (or loss) from rents or receipts from roomers or boarders; royalties; interest, dividends, and periodic income from estates and trust funds; Social Security benefits; pensions; veterans' payments, military allotments for dependents, unemployment insurance, and public assistance or other governmental payments; and contributions for support from persons who are not members of the household, alimony, and periodic receipts from insurance policies or annuities.

Receipts from the following sources were not included as income: Money received from the sale of property owned; the value of income "in kind," such as food produced and consumed in the home or free living quarters; withdrawals of bank deposits; money borrowed, tax refunds; gifts and lump-sum inheritances or insurance benefits.

Since the unit of tabulation for income data in this volume is an occupied unit, the statistics relate to the income of the primary family or primary individual occupying the housing unit; that is, the sum of the income of the head of the primary family and all

Introduction XXIII

other members of the family 14 years old and over, or the income of the primary individual. Incomes of persons living in the unit but not related to the head of the household are not included in this sum. Although the time period covered by the income statistics is the calendar year 1959, the composition of the household refers to the time of enumeration. Thus, the income of the family does not include against received by persons who were members of the family during all or part of the calendar year 1959 if these persons no longer resided with the family at the time of the interview. On the other hand, family income includes amounts reported by related persons who did not reside with the family during 1959 but who were members of the families, however, the income reported was received by persons who were members of the family throughout 1959.

The median income is the amount which divides the distribution into two equal parts—one-half the cases falling below this income and one-half the cases exceeding this income. In the computation of the median, the lower limit of the class interval was assumed to stand at the beginning of the income group and the upper limit at the beginning of the successive income group. Medians were rounded to the nearest hundred dollars.

As in all censuses and surveys of income, the figures are subject to errors of response and nonreporting. The amounts reported for income are frequently based not on records but on memory, and this factor probably produces underestimates, because the tendency is to forget minor or irregular sources of income. Other errors of reporting are due to misunderstanding of the income questions or to misrepresentation.

A possible source of understatement in the income figures was the assumption in the editing process that no income other than earnings was received by a person who reported the receipt of either wage or salary income or self-employment income but failed to report on the receipt of other money income. When no income information was reported for a person, the procedure used was to assign the reported income of a person with similar demographic characteristics.

Primary families and individuals with no income, as defined in the census, were included in the lowest income group (less than \$2,000). Many of these were living on income "in kind," savings, or gifts; or they were new primary families or individuals, or were families in which the sole breadwinner had recently died or left the household. However, many of the families and individuals who reported no income probably had some money income which was not recorded in the census.

The income data collected in the census cover money income only. The fact that some families (particularly those living on farms) receive an important part of their income in the form of free housing and of goods produced and consumed rather than in money should be taken into consideration. In comparing income data for 1959 with earlier years, it should be noted that an increase or decrease in money income does not necessarily represent a comparable change in real income, because adjustments for changes in prices have not been made in this volume.

In 1950, information on income similar to that requested in 1960 was obtained from a sample of persons 14 years old and over. If the sample person was the head of a family, the income questions were repeated for the other family members as a group in order to obtain the income of the whole family. In 1960, however, separate income data were requested from each person 14 years old and over in the sample. This change in procedure resulted in improved coverage of family income in 1960 and should be taken into consideration when comparing 1950 and 1960 data (see *United States Summary*, 1960 Census of Population, Volume I, Characteristics of the Population, or Series PC(1)-1C).

The income data in this report also differ from income data for families and unrelated individuals in the 1960 Population reports. As used in the Population reports, "families" refers to both primary and secondary families and "unrelated individuals" refers to primary and secondary individuals.

For several reasons, the income data reported in the census are not directly comparable with data which may be computed from other sources. Lack of comparability is attributable to differences in the types of income that are reported and the types of families and individuals to which the income applies.

COLLECTION AND PROCESSING OF DATA

The collection and processing of data in the 1960 Census differed in several important respects from the procedures used in the 1950 Census. Much of the information in 1960 was obtained by self-enumeration supplemented by follow-up procedures, in contrast with direct interview in 1950; a two-stage census was introduced in the more populous sections of the country, representing about four-fifths of the population; and much greater use was made of sampling than in 1950. A further innovation was the formal review of the enumerator's work during the course of enumeration. Finally, more extensive use was made of electronic equipment in 1960 to process the data and produce the final tables.

A summary of the procedures for collecting and processing the data is given below. Additional information on the 1960 practices is given in 1960 Census of Housing, Volume I, States and Small Areas and in United States Censuses of Population and Housing, 1960: Principal Data Collection Forms and Procedures. A detailed description of the collection and processing of data is provided in a report entitled Eighteenth Decennial Census: Procedural History.

COLLECTION OF DATA

Data collection forms.—Two basic types of forms were used for collecting data in the 1960 Census—the Advance Census Report (ACR) and the Household Questionnaire which respondents were asked to fill, and the FOSDIC schedules which the enumerators used to record the information for processing.

Enumeration procedures.—Before the enumeration began, the Post Office Department delivered an ACR to households on postal delivery routes in all parts of the United States. This form contained questions which were to be answered for every occupied unit and every person. Household members were requested to fill the ACR and have it ready for the enumerator when he called. The enumerator transcribed the information from the ACR to a FOSDIC schedule, or entered it directly on the FOSDIC schedule during direct interview.

In the densely populated areas of the United States (with approximately 82 percent of the population and 35 percent of the land area), the enumerator who called for the ACR left a Household Questionnaire with each sample household. The questionnaire was to be completed for the sample housing unit and for each person in the household and mailed to the local census office. Subsequently, the information was transcribed from the Household Questionnaire to a sample FOSDIC schedule. If the enumerator found that the questionnaire was incompletely filled or had not been mailed, or if he detected answers containing obvious inconsistencies, he obtained the information by personal visit or by telephone. In the populous areas, accordingly, the census data were obtained in a "two stage" procedure—the first stage for the collection of data for the 100-percent items and the second stage for the sample items.

In the remaining areas, a "single stage" procedure was used. When the enumerator picked up the ACR, he obtained the information for the sample items by direct interview and recorded it directly on the sample FOSDIC schedule.

Methods of obtaining information.—Information was obtained through self-enumeration, direct interview, and observation. The following were self-enumeration items which appeared on the AOR: Persons in the household, relationship to head, sex, color, age, marital status, kitchen or cooking equipment, rooms, water supply, toilet and bathing facilities, and tenure. Value of property and monthly contract rent appeared on the ACR in the cities and places for which city block statistics are published (and on the Household Questionnaire elsewhere).

The remaining questions for occupied units appeared as self-enumeration items on the Household Questionnaire with the following exceptions. Condition of a unit was always determined by the enumerator through his observation; access to the unit was determined largely by the enumerator's observation; information required for identifying separate housing units was obtained through observation, direct interview, and self-enumeration; number of units in structure was determined by the enumerator largely on the basis of the listing of units in the census; and, in structures with five housing units or more, information on such items as year built, heating equipment, and heating fuel was to be obtained by the enumerator from the resident owner, manager, or janitor. Items not filled on the ACR or on the Household Questionnaire were enumerated by direct interview.

For vacant units, the enumerator obtained information largely from owners, landlords, neighbors, or other persons presumed to know about the unit and recorded the information directly on the FOSDIC schedule. For certain items, as discussed above for occupied units, the enumerator recorded the information on the basis of his observation.

Field review.—One of the important innovations in the 1960 Census was a series of regularly scheduled "field reviews" of the enumerator's work by his crew leader or by a field reviewer. This operation was designed to assure at an early stage of the work that the enumerator was performing his duties properly and had corrected any errors he had made.

PROCESSING OF DATA

Electronic processing.—Although mechanical equipment was widely used in the 1950 and 1960 Censuses in the editing, coding, and tabulating, the procedures adopted in 1960 differed in several important respects from those used in 1950. The procedural changes reflect, in large part, the shift from conventional mechanical equipment to electronic equipment, which had been applied to the processing on a relatively limited scale in 1950.

In 1960, information was recorded on FOSDIC schedules in the form of shaded markings. The schedules were microfilmed, and the markings were converted to signals on magnetic tape by FOSDIC (Film Optical Sensing Device for Input to Computers). The tape, in turn, was processed by an electronic computer, which was used extensively to edit, code, and tabulate the data. A high-speed electronic printer printed the numbers, captions (column heads), and stubs on the final tables.

In 1950, the enumerator recorded the information by marking a precoded checkbox or writing in the entries. Punchcards were prepared, and conventional mechanical equipment was used for the most part to edit, code, and tabulate the data (practically all the housing items, but only some of the population items, were edited and coded mechanically). For 1950 Housing Vol-

ume II, however, electronic equipment was used to tabulate the data, and the tables were typed manually.

The extensive use of electronic equipment in the 1960 Census insured a more uniform and more flexible edit than could have been accomplished manually or by less intricate mechanical equipment. In the editing operations, improved techniques of allocation for nonresponses and inconsistencies were feasible. Moreover, the use of FOSDIC completely eliminated the cardpunching operation and thereby removed one important source of error in the published statistics; the new types of error introduced by the use of FOSDIC were probably minor by comparison.

In 1960, practically all the editing and coding operations for housing characteristics were accomplished by electronic equipment. For household characteristics, however, a few items were edited and coded manually. These were items which required the reading of written entries rather than the reading of marked circles.

Editing.—In a mass statistical operation, such as a national census, human and mechanical errors occasionally arise in one form or another, such as failure to obtain or record the required information, recording information in the wrong place, misreading position markings, and skipping pages. These were kept to a tolerable level by means of operational control systems. Nonresponses and inconsistencies were eliminated by using the computer to assign entries and correct inconsistencies. In general, few assignments or corrections were required, although the amount varied by subject and by enumerator. Whenever information was missing for a housing item, an allocation procedure was used to assign an acceptable entry, thereby eliminating the need for a "not reported" category in the tabulations. An acceptable entry was assigned also when the reported information was inconsistent. A similar procedure was followed when information was missing or was unacceptable for a population item (although for some population items, shown in other reports, a "not reported" category was retained).

The assignment of an acceptable entry was based on related information reported for the housing unit or person or on information reported for a similar unit or person in the immediate neighborhood. For example, if tenure for an occupied unit was omitted but a rental amount was reported, the computer automatically edited tenure to "rented." On the other hand, if the unit was reported as "rented" but the amount of rent was missing, the computer automatically assigned the rent that was reported for the preceding renter-occupied unit.

Another technique is illustrated by the procedure used in the assignment of wage or salary income, which is one of the components of total income. The computer stored reported wage or salary income, by sex, age, color, major occupation group, and number of weeks worked in 1959. Each stored income was retained in the computer only until a succeeding person having the same characteristics and having income reported was processed through the computer. The stored income was assigned to the next person whose wage or salary income was unknown and who otherwise had the same characteristics.

The extent of the allocations for nonresponse or for inconsistency is shown for States, urban places by size group, and other areas in appendix tables in the State chapters of Volume I of the 1960 Housing reports and in chapters B, C, and D of Volume I of the 1960 Population reports.

Specific tolerances were established for the number of computer allocations acceptable for a given area. If the number was beyond tolerance, the data were rejected and the original schedules were re-examined to determine the source of the error. Correction and reprocessing were undertaken as necessary and feasible.

In earlier censuses, assignments of acceptable entries for nonresponses and inconsistencies also were based on related in-

¹ States enumerated completely on a single-stage basis were: Alaska, Arkansas, Hawaii, Idaho, Mississippi, Montana, Nevada, New Mexico, North Dakota, South Dakota, and Wyoming. States enumerated partly, but not completely, on a single-stage basis were: Alabama, Arizona, California, Colorado, Florida, Georgia, Kansas, Kentucky, Louisiana, Maine, Michigan, Minnesota, Nebraska, Oklahoma, Oregon, Texas, Utah, Washington, and Wisconsin.

formation given for the units. In the absence of related information for the unit, either an acceptable code was assigned or the item was "not reported." If a code was assigned, it was made on the basis of distributions of characteristics from previous censuses or surveys. The use of electronic equipment in 1960 improved upon the procedure by making feasible the use of information implicit in the 1960 data being tabulated.

ACCURACY OF DATA

As explained earlier, information was obtained through selfenumeration and direct-interview procedures. The forms used by household members for self-enumeration were necessarily different from those used by the enumerator in direct interview, although the intent of the two types of forms was the same. The use of self-enumeration forms allowed household members to see the questions as worded and to consult household records to ascertain the correct answers. Furthermore, the self-enumeration forms provided brief but uniform explanations for some of the items and called attention to the response categories in a uniform manner. The less detailed wording for some items on the FOSDIC schedules was supplemented by the training and instructions given to the enumerators. The enumerators received standardized and formal training in canvassing their districts, in interviewing, and in filling out the schedules. During training, they used a workbook which contained practice exercises and illustrations. Filmstrips with accompanying narratives and recorded interviews were also used. The fine distinctions made in the instructions, however, were probably not ordinarily conveyed to the respondents, unless they asked the enumerator for clarification of a particular point.

In the processing of the data, careful efforts were made at each step to reduce the effects of errors. Errors occurred through failure to obtain complete and consistent information, incorrect recording of information on the FOSDIC schedules or incorrectly transferring it from the self-enumeration forms, faulty markings of the FOSDIC schedules, and the like.

Some of the innovations in the 1960 Census reduced errors and others produced a more consistent quality of results. It is believed that the innovations have improved the quality of the results compared with those of earlier censuses but, at the same time, have introduced an element of difference in the statistics. According to present plans, one or more reports evaluating the statistics of the 1960 Census will be published later.

Statistics in this volume may differ from those in other reports from the 1960 Census of Housing where different tabulation rates were used for the same item (for example, some characteristics of vacant units are based on the 25-percent sample in this volume and the 100-percent enumeration in Volume I of the 1960 Housing reports; differences result from sampling variability and from separate processing of the 100-percent and the sample tabulation forms).

SAMPLE DESIGN AND SAMPLING VARIABILITY

SAMPLE DESIGN

Although some information was collected for all housing units and all persons, all the data in this volume are based on samples. The unit of sampling was the housing unit and all its occupants. The enumerator was instructed to assign a Sample Key letter (A, B, C, or D) to each housing unit sequentially in the order in which he first visited the unit, whether or not he completed the interview. Each enumerator was given a random key letter to start his assignment, and the order of canvassing was indicated in advance, although the instructions allowed some latitude in the order of visiting and listing individual units at an address. Each housing unit which was assigned the key letter "A" was designated as a sample unit for housing data, and all persons enumerated in the unit were included in the sample for population data.

Information for the housing units and persons in the sample was recorded on sample FOSDIC schedules. For population data, there was one form of the sample FOSDIC schedule. For housing data, every fifth sample FOSDIC schedule carried questions comprising the 5-percent sample items; the other four-fifths carried questions comprising the 20-percent sample items. Items which appeared on both types of housing schedules comprised the 25-percent sample items. Thus, the population sample consisted of approximately 25 percent of the population, while the housing sample was 5, 20, or 25 percent of the housing units.

Although the sampling procedure did not automatically insure an exact 25-percent sample of persons or 25-, 20-, or 5-percent sample of housing units in each area, the sample design was unbiased if carried through according to instructions. Generally, for large areas, the deviation from the estimated sample size was found to be quite small. Biases may have arisen, however, when the enumerator failed to follow his listing and sampling instructions exactly. The 25-percent sample as finally processed comprised 24.53 percent of the total occupied housing units and 24.71 percent of the total population in the United States as a whole.

Sample rate for tabulation.—In this volume, an item may be cross-tabulated with other items having different sample rates. When an item was classified by an item with smaller sample size, the cross-tabulation necessarily was based on the smaller sample.

TABLE A.—SAMPLE RATE FOR TABULATION

(Rate shown in percent)

Trans snown	in bercent	l							
	Cross-tabulated by-								
Subject	Rooms	Condition and plumbing	in 1959	Year built					
Air conditioning			5 5	5					
Cooking fuel			5	5 5 20					
Source of water Television sets All other items (incl. total lines)			5 25	20					

Note: Data in table 7 are based on 25-percent sample.

Table A gives the sample rate at which an item was tabulated for the specific tables in which it appears. For example, year built in table 4 was tabulated from the 20-percent sample when classified by number of units with sewage disposal, and from the 25-percent sample when classified by number of persons.

In all tables, the figures on the total lines for "all occupied," "owner occupied," "renter occupied," "cash rent," "no cash rent," "vacant," "vacant available for sale," and "vacant available for rent" units are based on the 25-percent sample when tabulated by rural-nonfarm and farm residence. For subjects within a table that are based on the 25-percent sample, the figures in the distribution add to the total; for subjects tabulated at a different sample rate, the distributions may not add to the total. For total rural units (nonfarm and farm), counts of units in each of the tenure groups are involved in the ratio estimation procedure (see section on "Ratio estimation").

Medians are computed from distributions based on weighted samples tabulated at the rate indicated for the subject in table A. The median is not shown where the base is smaller than a specified size. If the cross-tabulation is based on the 25-percent sample, the median is not shown where the base is less than 200 housing units; if the cross-tabulation is based on the 20-percent sample, the minimum base is 250 housing units; if the cross-tabulation is based on the 5-percent sample, the minimum base is 1,000 housing units. For example, median income in 1959 in the last column of table 3 is not shown for units which are dilapidated if the total number of dilapidated units is less than 200; median income is not shown for units with air conditioning unless the total number of air-conditioned units is 1,000 or more.

RATIO ESTIMATION

The statistics based on samples of housing units are estimates that were developed through the use of a ratio estimation procedure. Essentially this procedure was carried out for each of seven groups of housing units in each area, separately for the 25-, 20-, and 5-percent samples.² The groups are as follows:

Group	Tenure, color, vacancy status
1	Owner occupied, white
2	Owner occupied, nonwhite
3	Renter occupied, white
4	Renter occupied, nonwhite
อั	Vacant, available for sale only
6	Vacant, available for rent
7	Vacant, other

For each of the seven groups, the ratio of the complete count to the sample count of housing units in the group was determined. Each sample housing unit in the group was assigned an integral weight so the sum of the weights would equal the complete count for the group. For example, if the ratio for a group was 4.2, one-fifth of the housing units (selected at random) within the group were assigned a weight of 5, and the remaining four-fifths, a weight of 4. The use of such a combination of integral weights rather than a single fractional weight was adopted to avoid the complications involved in rounding. For the 25-percent sample tabulations, where there were fewer than 50 housing units in the complete count in a group or where the resulting weight was over 16, groups were, in general, combined in a specific order to satisfy these two conditions. Similar procedures with appropriate values were used for the 20- and 5-percent sample tabulations.

The ratio estimates achieve some of the gains of stratification which would have been obtained if the sample had been stratified by the groups for which separate ratio estimates were computed. The net effect is a reduction in the sampling variability and in the bias of many statistics below that which would be obtained by weighting the results of the 25-percent sample by a uniform factor of 4 (the 20-percent sample by 5 or the 5-percent sample by 20). The reduction in sampling variability is trivial for some items and substantial for others.

Rural nonfarm and farm.—The ratio estimation procedure was generally applied to the smallest complete geographic area for which any data were to be published. Thus, the area may be a city, tract within a city, county, SMSA, urbanized area, or the rural part of a county. The rural nonfarm and farm units in a county, however, do not represent complete areas; therefore, data

$$x' = \sum_{i=1}^{7} \frac{x_i}{y_i} Y_i$$

where x' is the estimate of the characteristic for the area obtained through the use of the ratio estimation procedure,

x: is the count of sample housing units with the characteristic for the area in one (i) of the 7 groups,

y: is the count of all sample housing units for the area in the same one of the 7 groups, and

Y: is the complete count of housing units for the area in the same one of the 7 groups.

by rural nonfarm and farm residence are not subject to the reduction in sampling variability which is achieved by the ratio estimation procedure. Distributions of characteristics which were tabulated at different sample rates may not add to the same total. For example, in table 4 for rural-nonfarm units in an economic subregion, the total of the distribution of units by number of rooms (which was tabulated from the 25-percent sample) may differ somewhat from the total of the distribution by bedrooms (which was tabulated from the 5-percent sample).

SAMPLING VARIABILITY

Standard error of numbers and percentages.-The figures in this volume are subject to sampling variability, which can be estimated by using factors from table D in conjunction with table B for absolute numbers and with table C for percentages.8 These tables do not reflect the effect of response variance, processing variance, or bias arising in the collection, processing, and estimation steps. Estimates of the magnitude of some of these factors in the total error are being prepared and will be published at a later date. The chances are about 2 out of 3 that the difference due to sampling variability between an estimate based on a sample and the figure that would have been obtained from a complete count is less than the standard error. The chances are about 19 out of 20 that the difference is less than twice the standard error and about 99 out of 100 that it is less than 21/2 times the standard error. The amount by which the estimated standard error must be multiplied to obtain other odds deemed more appropriate can be found in most statistical textbooks.

Table B shows estimates proportionate to the standard errors of estimated numbers of housing units. Table C shows estimates proportionate to the standard errors of estimated percentages of housing units. Table D provides a factor by which the estimates proportionate to the standard errors shown in tables B and C should be multiplied to adjust for the combined effect of the sample design and the estimation procedure.

To estimate a standard error for a given characteristic, locate in table A the sample rate used in the tabulation; from table D, determine the factor that applies to the distribution or crosstabulation according to the sample rate used; multiply this factor by the estimate proportionate to the standard error given for the number as shown in table B. The product of this multiplication is the approximate standard error. Similarly, to obtain an estimate of the standard error of a percentage, multiply the figure as shown in table C by the factor from table D. For most estimates, linear interpolation in tables B and C will provide reasonably accurate results.

In table D, the factors as shown apply to the standard errors of estimates in the simple distribution of the item which appears in the "total" column or in the "total" line of a table. For statistics within the cross-classifications, however, the factors shown in table D for the two subjects being cross-classified (at the sample rate indicated in table A) may differ. When this occurs, the larger of the two factors from table D should be used.

Illustration: Table 3 shows owner-occupied housing units classified by income and also by air conditioning. Assume the table shows a total of 50,000 housing units with income of \$6,000 to \$6,999, a total of 30,000 housing units with air conditioning, and 5,000 housing units with air conditioning in the income class of \$6,000 to \$6,999.

According to table A, the total line for owner-occupied housing units in table 3 is based on the 25-percent sample. Table D shows that the factor for income from the 25-percent sample is 1.2. Table B shows that the estimate proportionate to the standard error of an estimate of 50,000 housing units is about 350. The factor of 1.2 times 350, or 420, means that the chances are approximately 2 out of 3 that the results of a complete count

 $^{^{2}}$ Estimates of characteristics of the housing units from the sample for a given area are produced using the formula :

^{3.}These estimates of sampling variability are based on calculations from a preliminary sample of the 1960 Census results. Further estimates are being calculated and will be available at a later date.

Introduction XXVII

TABLE B.—Estimates Proportionate to Standard Error of Estimated Number

[Range of 2 chances out of 3; for factors to be applied, see table D and text]

Estimated number ¹	Estimate propor- tionate to standard error	Estimated number ¹	Estimate propor- tionate to standard error
50	15	5,000	110
	20	10,000	160
	30	15,000	190
	40	20,000	220
	50	25,000	250
	80	50,000	350

¹ For estimated numbers larger than 50,000, the relative errors are somewhat smaller than for 50,000.

TABLE C.—Estimates Proportionate to Standard Error of Estimated Percentage

[Range of 2 chances out of 3; for factors to be applied, see table D and text]

Estimated percentage	Base of percentage									
	500	1,000	2,500	10,000	25,000	50,000				
2 or 98	1.3 2.0 2.8 3.8 4.4	0. 9 1. 4 2. 0 2. 7 3. 1	0. 5 0. 9 1. 2 1. 5 1. 6	0. 8 0. 4 0. 6 0. 7 0. 8	0. 1 0. 2 0. 3 0. 4 0. 5	0. 1 0. 2 0. 2 0. 3 0. 3				

would not differ by more than 420 from the estimated 50,000. It also follows that there is only about 1 chance in 100 that the results of a complete count would differ by as much as 1,050, that is, by $2\frac{1}{2}$ times the standard error.

Air conditioning in table 3 is based on the 5-percent sample according to table A. The factor for air conditioning (for the 5-percent sample) shown in table D is 2.8. Table B shows that the estimate proportionate to the standard error of an estimated 30,000 housing units is about 270. The factor of 2.8 times 270, or 756, is the estimated standard error of the total number of housing units having air conditioning.

For the 5,000 units with air conditioning in the income class \$6,000 to \$6,999, table A shows that a cross-tabulation of this type is based on the 5-percent sample. The factor for income when based on the 5-percent sample is 3.0 according to table D, and the factor for air conditioning is 2.8; for the cross-tabulation, the larger factor (3.0) should be used. Table B shows that the estimate proportionate to the standard error for an estimate of 5,000 housing units is about 110. Applying the factor of 3.0 to the 110 gives an estimated standard error of approximately 330.

Standard error of differences.—The standard errors estimated from tables B and C (using factors from table D) are not directly applicable to differences between two estimates. The estimates of sampling errors are to be applied differently in the following three situations:

- 1. For a difference between two sample estimates (e.g., one from 1960 and the other from 1950, or both from the same census year), the standard error is approximately the square root of the sum of the squares of the standard error of each estimate considered separately. This formula will represent the standard error quite accurately for the difference between estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.
- 2. For a difference between two sample estimates one of which represents a subclass of the other (e.g., units in sound condition and having all plumbing facilities as a subclass of all units in sound condition), the difference should be considered as the sample estimate; the standard error of this difference may be obtained directly.
- 3. For a difference between a sample estimate and one based on a complete count, the standard error of the difference is identical with the standard error of the estimate based on the sample.

TABLE D.—FACTOR FOR ESTIMATING STANDARD ERROR

[Factors below are applicable to the standard errors of distribution in the column and line totals. To estimate factor for cross-classification, see procedure in text. Refer to table A for sample rate applying to data tables]
